Posture, Attitude. 'Posture is generally natural; attitude is studied either for the general purpose of looking graceful, or as illustrative of a subject or of words. A placement of the body for the purpose of ridicule would be an absurd posture as having not the dignity which belongs to attitude. An unintentional display of grace in a figure, as when casually thrown upon the ground, would be expressed by posture. . . . the contrary would be an ungraceful posture. . . . But the term attitude is more honourable than posture. Positions of the body which are forced, odd, ungainly, are called postures. Those which are noble, agreeable, and expressive, in which the expression of the countenance aids the pose of the limbs and body, are called attitudes. . . . The term posture commonly embraces the whole body; attitude is applicable to parts of it, as a head in a reclining attitude.' *Smith's Synonyms.*

Potash (pót'ash), *n.* [*Pot* and *ash*, from being prepared for commercial purposes by evaporating the lixivium of wood-ashes in iron pots.] The popular name of vegetable fixed alkali in an impure state, procured from the ashes of plants by lixiviation and evaporation. The matter remaining after evaporation is refined in a crucible or furnace, and the extractive substance burned off or dissipated. Refined potash is called *pearlash*, and is in that state an impure carbonate of potash. The production of potash is carried on upon a large scale in Russia and America, where wood is abundant and of little value. With the acids potash forms a variety of useful salts. It is largely employed in the manufacture of flint-glass and soap, the rectification of spirits, bleaching, making alum, scouring wool, &c. It is also extensively used in medicine. Pure potash is the protoxide of potassium, or potassa, but in its impure state it is

largely mixed with sulphur and carbonaceous products.—*Potash water*, an aerated beverage consisting of carbonic acid water, to which is added bicarbonate of potash.

Potassium (pót-tas'si-um), *n.* [A latinized term from *potash*.] Syn. K.; at. wt. 39.1. A name given to the metallic basis of potash, discovered by Davy in 1807, and one of the first-fruits of his electro-chemical researches. Next to lithium it is the lightest metallic substance known, its specific gravity being 0.865 at the temperature of 60°. At 32° it is hard and brittle, with a crystalline texture; at 50° it becomes malleable, and in lustre resembles polished silver; at 150° it is perfectly liquid. At ordinary temperatures potassium may be cut with a knife. Potassium has a very powerful affinity for oxygen, which it takes from many other compounds. A freshly exposed surface of potassium instantly becomes covered with a film of oxide. The metal must therefore be preserved under a liquid free from oxygen, rock-oil or naphtha being generally employed.

Potato (pót-tā-tō), *n. pl.* **Potatoes** (pót-tā-tōz). [Sp. *patata*, *batata*, the name originally applied to the batatas or sweet-potato, and said to be a native Haytian word.] 1.† The sweet-potato. See **BATATAS**. [This was the original application of the name, and it is in this sense that the word is generally to be understood when used by English writers down to the middle of the seventeenth century.]—2. The plant, or one of its esculent tubers, botanically known as *Solanum tuberosum*, a native of South America. The tubers of this plant constitute one of the cheapest and most nourishing species of vegetable food; it is the principal food of the poor in some countries, and has often contributed to prevent famine. It is supposed to have been introduced into the British dominions by Sir Walter Raleigh in the sixteenth century; but it came slowly into use, and even yet is not much cultivated in some countries of Europe. There are a great many varieties of the potato, arising from soil, culture, and other circumstances; these differ in the time of ripening, in their form, size, colour, and quality; and in general every district has its peculiar or favourite varieties, the names being quite arbitrary or local. Some degenerate and others improve by removal to another district. New varieties may be readily procured by sowing the seeds, which with care will produce tubers the third year, and a full crop the fourth.—*Potato apple*, the seed of the potato.—*Potato beetle*, *potato bug*. See **COLORADO BEETLE**.—*Potato disease*, *potato blight*, *potato murrain*, a disease affecting potatoes, first noticed in this country in 1845. The cause is a fungus or white mould (*Peronospora infestans*), whose spores first attach themselves to the leaves of the plants, betraying their presence by brown specks, each surrounded by a paler ring consisting of a white mould or fungus. The mould spreads with great rapidity, especially in moist warm weather, converting the green cells into brown, and destroying all before it. The spots soon become confluent, the evil extends to the stems, so that in a few days the whole becomes putrid. At last the tubers become affected with brown spots both on their substance and within their tissue, and decay sets in with less or more rapidity. It has been stated that the immediate cause of the disease is the death of the fungal threads, which on decomposition act as a putrescent ferment on tissues. Some assert that a more remote cause is an insect (*Eupterix*), which punctures the leaves, and so renders them a more ready prey to the fungus; while others hold that the plant has degenerated through being too long cultivated. Powdering the sets with flowers of sulphur, early planting, and the removal of the haulms as soon as

the disease appears, have been recommended as preventive or remedial measures. The starch in the tubers is not affected by it, so that as good potato starch is made from unsound as from sound potatoes; and this manufacture, in years when the disease was severe, has been carefully developed.—*Potato mildew*, *Peronospora infestans*. See *Potato disease*, above.—*Potato oat*, a variety of the oat (*Avena sativa*).—*Potato scab*, a fungus plant, the *Tubercinia scabiei*, found beneath the skin of the tuber of the potato, producing superficial cavities and pits.—*Potato starch*, a fecula obtained from the potato, and called *English Arrow-root*.—*Potato sugar*, a species of sugar manufactured from potato flour.—*Oil of potatoes*, a colourless substance obtained from spirits made from potatoes. It is somewhat oily in appearance, has a strong smell, at first pleasant, but afterwards nauseous; taste very acrid.—*Sweet potato*, the *Batatas edulis*. See *BATATAS*.

In like manner the successive powers of the quantity *a* are, *a*, *a*², *a*³, *a*⁴, &c. The numbers which indicate the powers of quantities are called the *indices* or *exponents*. equinoctial points, viz., from east to west, or contrary to the order of the signs. The equinoctial points do not retain the same position in the heavens, but have a slow retrograde motion at the rate of about 50" in a year, or about a degree in 71 642 years, the equator moving on the ecliptic while the ecliptic remains nearly coincident with the same fixed stars. This phenomenon is caused by the combined action of the sun and moon on the mass of matter accumulated about the earth's equator, and is called the precession of the equinoxes, because it makes the equinoxes succeed each other in less time than they would otherwise do. In consequence of the precession of the equinoxes, the longitudes and right ascensions of the heavenly bodies are continually increasing, and owing to the motion of the equator, which occasions that precession, their declinations also are altered. The precession of the equinoxes was discovered by Hipparchus a century and a half before the Christian era, though it is alleged that the astronomers of India had discovered it long before. At that time the point of the autumnal equinox was about 6° to the eastward of the star called Spica Virginis. In 1750, that is, about 1900 years after, this point was observed to be about 26° 21' westward of that star. Hence it appears that the equinoctial points will make an entire revolution in about 25,745 years.

Pre-Raphaelitism (pré-ra'f-a-el-it-izm), *n.* The system or style of painting practised by the early painters before the time of Raphael; the modern revival of their style or system. The essential characteristic of the style is a rigid adherence to natural form and effect, and the consequent rejection of all efforts to elevate, beautify, or heighten the effect in any way by ideal modifications either in drawing, arrangement, or colouring, based on conventional rules derived from the works of the great masters of the several schools. See *extract*.

Pre-Raphaelitism has but one principle, that of uncompromising truth in all that it does, obtained by working everything, down to the most minute detail, from nature and from nature only. Or, where imagination is necessarily trusted to, by always endeavouring to conceive a fact as it really was likely to have happened, rather than as it most prettily might have happened. Every *pre-Raphaelite* landscape background is painted to the last touch, in the open air, from the thing itself. Every *pre-Raphaelite* figure, however studied in expression, is a true portrait of some living person. Every minute accessory is painted in the same manner. . . . This is the main *pre-Raphaelite* principle.

Our conclusion, then, respecting the whole question of *first principles*, speculative and practical, is this, that although in their abstract form they are not innate, yet that there are innate faculties, or laws of thought which, when put into action by experience, necessarily give rise to them as primitive judgments; and that these judgments, at first applied in the concrete, at length by a process of abstraction, assume a perfect axiomatic form. Experience, accordingly, is the occasion of their production, but their real cause or origin is to be found in the native energy of the human mind. *F. D. Morell.*

There are no two words in the English language used so confusedly one for the other as the words *rule* and *principle*. . . . You can make a *rule*; you cannot make a *principle*; you can lay down a *rule*; you cannot, properly speaking, lay down a *principle*. It is laid down for you. You can establish a *rule*; you cannot, properly speaking, establish a *principle*. You can only declare it. *Rules* are within your power, *principles* are not. Yet the mass of mankind use the words as if they had exactly similar meanings, and choose one or the other as may best suit the rhythm of the sentence. Helps.

Printer (print'ér), *n.* One who prints books, pamphlets, newspapers, and such like; also, one who prints cloth, or one who takes im-

on paper, cloth, or other material; the business of a printer; typography. There are several distinct branches of the art, as the printing of books, &c., with movable types; typography; the printing of engraved copper or steel plates (see ENGRAVING); the taking of impressions from stone (see LITHOGRAPHY); and the impressing of a fabric with coloured designs (see CALICO-PRINTING). The most important branch of printing is what is called *letterpress printing*, or the method of taking impressions from letters and other characters cast or cut in relief upon separate pieces of metal, and therefore capable of indefinite combination. The impressions are taken either directly from the type surface or from stereotype plates (see STEREOTYPE), and are effected either by superficial or surface pressure, as in the hand printing-press, or by lineal or cylindrical pressure, as in the printing-machine, or by the action of a roller, as in the copperplate-press or roller-press. The pigments or inks, of whatever colour, are always laid upon the surface of the types or stereotype plate. Wood-cuts and other engravings in relief are also printed in this manner. In copper and steel plate printing the characters are engraved in intaglio, and the inks contained within the lines of the engravings, and not upon the surface of the plate. Cotton or calico printing is from surfaces engraved either in relief or in intaglio. The art of letterpress printing, which was invented by Gutenberg at Mentz, about the year 1450, is divided into two departments—*composition*, or the arrangement of the types, and *press-work*, or the taking off impressions from the types so arranged; the workmen employed are therefore distinguished into two classes—*compositors* and *pressmen*. Printing was first introduced into England by William Caxton about 1474 — 2. paratus; and they are moved either by hand, steam, or other power. In most cases the impression taken from the 'forms' worked by them is effected by a cylinder or several cylinders; in others by a flat press, like the press patent. The first self-acting printing-machine dates from a patent of W. Nicholson in 1790; the next practical attempt was made in 1804, at the expense of the late Mr. Walter of the *Times*, by T. Martyn. But the first working machine was constructed ten years afterwards by two ingenious Germans, Messrs. Koenig and Bauer. On this machine the *Times* of Nov. 29, 1814, was printed by steam, at the rate of 1100 impressions per hour. Since then successive improvements have raised the amount on that and other

journals to between 20,000 and 30,000 copies an hour. The printing-machine is now in use almost everywhere for nearly all kinds of printing whenever speed and economy are desirable. The engraving shows the well-known double-cylinder perfecting machine, which embodies the principle of Koenig and Bauer's. The blank sheet *a* is caught by a series of endless tapes and held in position round the large revolving cylinder *b*, under which is run the form of types previously inked by the rollers *c*. By means of the smaller intermediate cylinders *dd* the half-printed sheet is passed to the second large cylinder *e*, when its other side is printed, and the perfected sheet is delivered between the two cylinders *f*.

Promise (prom'is), *n.* [Fr. *promesse*, from *L. promissum*, from *promitto*, to send before or forward—*pro*, before, and *mitto*, to send.] 1. A declaration, written or verbal, made by one person to another, which binds the person who makes it to do or forbear a certain act specified; a declaration which gives to the person to whom it is made a right to expect or to claim the performance or forbearance of some act; especially, a declaration that something will be done or given for the benefit of another; as, to make a *promise*; to perform a *promise*.

And be these juggling fiends no more believed,
That palter with us in a double sense;
That keep the word of *promise* to our ear,
And break it to our hope. *Shak.*

2. In *law*, a declaration, verbal or written, made by one person to another for a good or valuable consideration, in the nature of a covenant, by which the promiser binds himself and, as the case may be, his legal representatives, to do or forbear some act; and gives to the promisee a legal right to demand and enforce a fulfillment.—*Promise and offer.* In *Scots law* an *offer* is a proposal made by the offeror to the person to whom the offer is addressed, to give or to do something either gratuitously or on an onerous consideration. A *promise* is an offer, with this addition, that the promiser, from the nature of his proposal, thinks it unnecessary to wait for the other party's assent, which he takes it for granted will be given as soon as the offer is known. An offerer is not bound till his offer is accepted. A promiser is bound as soon as the promise reaches the party to whom it is made. A promise may be *absolute* or *conditional*, *lawful* or *unlawful*, *express* or *implied*. An *absolute promise* must be fulfilled at all events. The obligation to fulfil a *conditional promise* depends on the performance of the condition. An *unlawful promise* is not binding, because it is void; for it is incompatible with a prior paramount obligation of obedience to the laws. An *express promise* is one expressed in words or writing. An *implied promise* is one which reason and justice dictate. If I hire a man to perform a day's labour, without any declaration that I will pay him, the law presumes a promise on my part that I will give him a reasonable reward, and will enforce such implied promise. A promise without deed is said to be by *parol*, and the term is usually applied to engagement by parol only, a promise by deed being technically called a *covenant*.—3. For never saw I *promise* yet of such a bloody fray. *Macaulay.*

Proteid (prō-tē'id), *n.* [See *PROTEIN*.] A name given to substances analogous in composition to protein, that is, consisting of carbon, hydrogen, oxygen, and nitrogen, sometimes united with sulphur and phosphorus. The gluten of flour, albumen, the fibrin of the blood, syntonin, which is the chief constituent of muscle and flesh, and casein are examples of proteids. Gelatin and chondrin Huxley calls outlying members of the same group. Proteids are the essential food-stuffs.

Food-stuffs have been divided into *heat-producers* and *tissue-formers*—the amyloids and fats constituting the former division, the *proteids* the latter. But this is a very misleading classification, inasmuch as it implies, on the one hand, that the oxidation of the *proteids* does not develop heat; and, on the other, that the amyloids and fats, as they oxidize, subserve only the production of heat. *Proteids* are *tissue-formers*, inasmuch as no tissue can be produced without them; but they are also *heat-producers*, not only directly, but because, as we have seen, they are competent to give rise to amyloids by chemical metamorphosis within the body. *Huxley*.

Proteidæ (prō-tē'id-ē), *n. pl.* A family of batrachians of the order *Urodela*, characterized by a compressed tail, as in the newts, and large branchie. The four limbs are developed. The axolotl and proteus are examples. See *AXOLOTL*, *PROTEUS*.

It forms a yellowish brittle mass, insoluble in water and alcohol, and is composed of carbon, hydrogen, nitrogen, and oxygen. Its existence, however, as a distinct proximate principle is doubtful. Often used adjectively, or as the first element in a compound. 'The hypothetical *protein*-substance.' *H. Spencer*.

guishing characteristic was the faculty of assuming different shapes; hence, one who easily changes his form or principles.—2. In *zool.* the name given to a genus of perennibranchiate batrachians. One species only has been hitherto discovered, namely, the *Proteus* or *Hypochthon anguinus*, a saurian which is found in subterranean lakes and caves in Illyria and Dalmatia. It attains a length of about 1 foot. The body is smooth, naked, and eel-like, the legs four in number, small and weak, the forefeet three-toed, the hinder four-toed, and, in addition to permanent external gills, it possesses lungs in the form of slender tubes. From its habitat the power of vision is unnecessary, and in point of fact its eyes are rudimentary and covered by the skin.—3. A genus of Protozoa, remarkable for changeableness of form. If one of these spores be liberated from the spore-case, and placed under favourable conditions, it germinates, giving off roots on the one hand, and producing on the other hand a little cellular expansion or leaf, which is termed the '*prothallus*.' This *prothallus*, however, is not itself developed into a new fern, but it is a mere temporary or provisional body, upon which are produced male and female organs of reproduction. The male organs are produced upon the under side of the *prothallus*; and they have the

form of minute cellular eminences, containing reproductive cells. These cells are liberated, when they burst, and give exit to true spermatozoa in the form of ciliated spiral filaments. The female organs are also placed upon the under surface of the *prothallus*, and also have the form of cellular prominences. The cells of these prominences are so arranged that they form a canal, leading down to a large central cell or ovule. *H. A. Nicholson.*

'My private *prothonotary*,' *Herriek*. Specifically, (a) in the *Rom. Cath. Ch.* originally one of seven officers charged with registering the acts of the church, lives of the martyrs, &c.; now one of twelve, constituting a college, who receive the last wills of cardinals, make informations and proceedings necessary for the canonization of saints, &c.; they are called *apostolical prothonotaries*. According to Professor Haeckel, the material universe, so far as we at present know it, resolves itself into minerals, *protista*, plants, and animals. I may say at starting that, along with most of my brother naturalists in Britain, I regard the introduction of this new 'kingdom,' the *Protista*, as a mistake; but as the proposal even involves most interesting questions as to relations between the three recognized kingdoms, it is well worthy of careful consideration. *Sir Weyville Thomson.*

Protopoccus (prō-tō-kok'us), *n.* [Gr. *prōtos*, first, and *kokkos*, a berry.] A genus of algae of the nat. order *Palmellæ*. *P. nivalis* (red-snow) appears on the surface of snow, tinged extensive tracts in the Arctic regions or amongst the Alps, in an incredibly short space of time, with a deep crimson. This plant, which may be regarded as one of the simplest forms of vegetation, consists of a little bag or membrane forming a cell. A large number of these are commonly found together, but each one is separate from the rest, and is to be regarded as a distinct individual. This is the still condition of the

Protopoccus nivalis (Red-snow), magnified and natural size.

cells. At other times they are found moving about rapidly by means of lash-like projections of their protoplasm.

See also *extract*.

A *protocol* is, in its first meaning, a document by which a fact is described with all its attendant circumstances, or by which an authentic and exact account of a conference or a deliberation is given. . . . The word has of late years acquired a second signification on the Continent; it is now often taken to indicate a convention which is not subject to the formalities of ratification. Subsidiarily, *protocol* means also the science of the shape of official letters.

Blackwood's Mag., January, 1874.

3. A record or registry. In Scotland, on the admission of a notary, he receives from the clerk-register a book marked by the clerk, which is called a *protocol*. In this book the notary is directed to insert copies of all the instruments he may have occasion to execute, to be there preserved as in a record. The *protocol* has now fallen into disuse.

At present the term is most commonly used in contradistinction to *per-compounds*, to designate those compounds of an element which contain relatively less of the electro-negative radical. Thus two chlorides of iron are known, FeCl₂ and FeCl₃; the former is called perchloride, the latter perchloride. The name is not so much used now as it was some years ago.

Protoplasm, Protoplasma (prō'tō-plazm, prō'tō-plaz'ma), *n.* [Gr. *prōtos*, first, and *plasma*, anything formed or moulded, from *plasseō*, to mould.] A substance consisting of carbon, oxygen, nitrogen, and hydrogen, nearly identical with the white of an egg, and constituting the basis of life in animal and plant structures. It is colourless, transparent, and apparently destitute of structure, and is seen in its simplest form in some of the lowest types of animal life, as in the Foraminifera and Monera. When unrestricted by an imprisoning envelope it is endued (as is seen in *Amoeba diffuens*) with the power of extending itself in all directions in the form of mutable processes which can be withdrawn at will, and it has also the power of passing or flowing in minute masses through closed membranes without these masses thereby losing their identity of form. In the form of cells, the skin of which is merely dead and hardened protoplasm, and inclosing a nucleus, or with a nucleus embedded in its substance, it is the structural unit of all organized bodies, constituting not only the basis of the ovum of both plants and animals, but of the tissues themselves in their perfect state, which are mere multiples of such cell-units variously modified. (The nucleus is believed by some to be doubtful, and due to imperfection in the glass.) As the protoplasm in our bodies is continually undergoing waste, a continuous renewal of the material is essential to the continuance of life. Animals, however, cannot elaborate protoplasm from mineral substances for themselves, they being able only to convert by the process of digestion dead protoplasm into living. Plants can, on the other hand, manufacture protoplasm from mineral compounds and the atmosphere, and so they are the storehouse of protoplasmic matter for the animal kingdom. Some biologists prefer the term *Bio-plasm* to that of *Protoplasm*, as being more expressive of its function.

Beast and fowl, reptile and fish, mollusk, worm, and polype, are all composed of structural units of the same character, namely, masses of protoplasm with a nucleus. There are sundry very low animals, each of which structurally is a mere colourless blood-corpucle, leading an independent life. But, at the very bottom of the animal scale, even this simplicity becomes simplified, and all the phenomena of life are manifested by a particle of protoplasm without a nucleus.

Huxley.

Harvey.

A *protoplast* is an organized individual, capable (either singly or as one of a pair) of propagating individuals; itself having been propagated by no such previous individual or pair. Protozoa (prō'tō-zō'a), *n.pl.* [Gr. *prōtos*, first, and *zōon*, an animal, from *zao*, to live.] A sub-kingdom including the most lowly organized members of the animal kingdom. The Protozoa may be defined to be animals composed of a nearly structureless jelly-like substance termed *sarcode*, not possessing permanent distinction or separation of parts, without a definite body cavity or trace of a nervous system, and having either no differentiated alimentary apparatus, or an extremely rudimentary one. The animals present the appearance of a transparent gelatinous cell containing a nucleus. In many, contractile vesicles have been observed which perform the office of a heart. Most are nourished by absorption through the general surface. Only in the Infusoria has a mouth been observed. The organs of locomotion are varied. In some of the higher forms movements are effected by means of cilia, in others by long whip-like bristles termed *flagella*, but the most characteristic organs of locomotion are processes named *pseudopodia*, consisting simply of prolongations of the sarcode substance of the body, which can be emitted and retracted at pleasure: in a few a thin marginal lamina propels the animal by its undulations. The Protozoa, with the exception of a few inhabiting the bodies of animals, are aquatic in their habits, and, save the sponges, generally of microscopic size. They are divided into two groups with regard to the presence or absence of a mouth—*stomatode* and *astomatous*—the former group consisting of the class Infusoria, and the latter of the classes Gregarinidae and Rhizopoda. Huxley subdivides the Protozoa into two groups, a lower and a higher. In the former, *Monera*, no definite structure is discernible in the protoplasm of the body; in the latter, *Endoplastica*, a certain portion of the substance (the so-called nucleus) is distinguishable from the rest, one or more contractile vesicles being commonly present. (See *MONERA*, *ENDOPLASTICA*.) Huxley further distinguishes those members of the Protozoa which move and feed by means of pseudopodia as *Myxopoda* or myxopods, while those in which the organs of locomotion and prehension are cilia or flagella he classes as *Mastigopoda* or mastigopods.

The pterodactyls had a moderately short tail, a long neck, and a large head; the jaws armed with equal and pointed teeth; most of the bones, like those of birds, were 'pneumatic,' that is, hollow and filled with air; but the chief character consisted in the excessive elongation of the outer digit (or little finger) of the forefoot, which served to support a flying membrane. Several species have been discovered.

With a long-snouted head and long neck, much resembling that of a bird, bat-like wings, and a small trunk and tail, with lacertian affinities in its skull teeth and skeleton, and with a bird-like structure of sternum and scapular arch, these creatures present an anomaly of structure as unlike their fossil contemporaries as the duck-billed ornithomorphus of Australia to existing mammals. . . . The size and form show that the *Pterodactylus* was capable of perching on trees, of hanging against perpendicular surfaces, and of standing firmly on the ground, when, with its wings folded, it might crawl on all fours, or hop like a bird.

Comp. *horse*, a kind of frame, Gr. *onos*, an ass, a crane, a pulley, and E. *crane*, L. *grus*, Gr. *geranos*, with the double sense of bird and mechanical contrivance in all the three languages.] 1. A small

Fig. 1.

and is used for raising weights. A single pulley serves merely to change the direction of motion, but several of them may be combined in various ways, by which a mechanical advantage or purchase is gained, greater or less according to their number and the mode of combination. The advantage gained by any combination or system of pulleys is readily computed by comparing the velocity of the weight raised with that of the moving power, according to the principle of virtual velocities. The friction, however, in the pulley is great, particularly when many of them are combined together. A pulley is said to be fixed when the block in which it turns is fixed, and it is said to be movable when the block is movable. In the single fixed pulley (fig. 1) there is no mechanical advantage, the power and weight being equal. It may be considered as a lever of the first kind with equal arms. In the single movable pulley (fig. 2) where the cords are parallel there is a mechanical advantage, there being

Fig. 2.

Fig. 3.

Fig. 4.

an equilibrium when the power is to the weight as 1 to 2. It may be considered as a lever of the second kind, in which the distance of the power from the fulcrum is

double that of the weight from the fulcrum. In a system of pulleys (figs. 3, 4) in which the same string passes round any number

Fig. 5.

of pulleys, and the parts of it between the pulleys are parallel, there is an equilibrium when the power is to the weight as 1 to the number of strings at the lower block. In a system in which each pulley hangs by a separate cord (fig. 6) and the strings are parallel, there is an equilibrium when the power is to the weight as 1 to that power of 2 whose index is the number of movable pulleys. Whatever be the mechanical arrangement of the pulleys and of the ropes the principle of all pulleys is the same, namely, the transmission of the tension of a rope without sensible diminution so as to obviate the loss of force consequent on rigidity. This term is used indifferently to denote either a single sheave or the complete block and its sheaves. See BLOCK.—2. In mach. a wheel, generally with a nearly flat face, which being placed upon a shaft transmits power to or from the different parts of machinery, or changes the direction of motion by means of a belt or band which runs over it.—Fast pulley, one firmly attached to the shaft from which it receives or to which it communicates motion.—Loose pulley, one running free on the shaft to receive the belt and allow it still to traverse without being affected by or affecting the motion of the shafting.—Speed pulley, one communicating varying speeds with a given rate of motion of the belt or cord; a cone-pulley (which see).—Sliding pulley, one placed upon a shaft so as to slide backwards and forwards upon it; used for coupling and disengaging machinery.

Pulsation (pul-sä'shon), *n.* [*L. pulsatio*. See PULSATE.] 1. The beating or throbbing of the heart or of an artery, in the process of carrying on the circulation of the blood; a beat of the pulse; a throb.

This *pulsation* involves an augmentation of the capacity of that portion of the artery in which it is observed, and it would seem to the touch as if this were chiefly effected by an increase of diameter. It seems fully proved, however, that the increased capacity is chiefly given by the elongation of the artery, which is lifted from its bed at each *pulsation*, and when previously straight becomes curved; the impression made upon the finger by such displacement not being distinguishable from that which results from the dilatation of the tube in diameter. *Dr. Carpenter*.

2. A beat or stroke by which some medium is affected, as in the propagation of sound. 3. In *civil law*, a beating without pain.

Pulse (puls), *n.* [*Fr. pouls*, *L. pulsus*, a beating, from *pello*, *pulsum*, to drive.] 1. In *physiol.* the beating or throbbing of the heart or blood-vessels, especially of the arteries. (See extract under PULSATON, 1.) In childhood the healthy pulse registers 100 to 110 beats a minute; in youth about 90; in maturity about 75; while in old age it sinks to about 60 and even less. In females it is somewhat higher, and during certain fevers it sometimes reaches 140 beats per minute. This motion is strongest in the heart, and from it is propagated through all the minutest branches of the arteries. In those which lie immediately under the skin it can be felt with the finger, as is the case with the radial artery, the pulsation of which is very perceptible at the wrist. The state of the pulse is therefore an indication of the action of the heart and the whole arterial system, and of the condition of the blood and the physical functions in general.—2. Any measured, regular, or rhythmical beat, any short, quick motion regularly repeated, as a medium in the transmission of light, sound, &c.; pulsation; vibration. 'The measured *pulse* of racing oars.' *Tennyson*.

Pump (pump), *n.* [Fr. *pompe*, a pump. 'Of Teutonic origin, from *G. pumpe*, a pump, of which a fuller form is *plumpe*, showing that an *l* has been lost. Comp. Prov. *G. plumpen*, to pump. The *G. plumpen* also means to pump, to fall plump, . . . so that the sense of pumping arose from the plunging action of the piston, or as it is sometimes called the *plunger*, especially when made solid, as in the force-pump. *Skeat.* *Plump*, *Skeat* farther derives from *L. plumbum*, lead.] An instrument, apparatus, or machine, consisting of a peculiar arrangement of a piston, cylinder, and valves, employed for raising water or other liquid to a higher level, or for exhausting or compressing air or other gases. (See **AIR-PUMP**.) Though the forms under which the hydraulic pump is constructed, and the mode in which the power is applied, may be modified in a great variety of ways, there are only three or four which can be considered as differing from each other in principle. These are the *sucking* or *suction pump*, the *lift-pump*, the *force-pump*, and the *rotary* or *centrifugal pump*. Of these the suction or common household pump is most in use, and for ordinary purposes the most convenient. The usual form and construction of this pump are shown in the annexed engraving. A piston *a*, is fitted to work air-tight within a hollow cylinder or barrel *b b*; it is moved up and down by a handle connected with the piston-rod, and is provided with a valve *e*, opening upwards. At the bottom of the barrel is another valve *f*, also opening upwards, and which covers the orifice of a tube *c*, called the suction-tube, &c., fixed to the bottom of the barrel, and reaching to the well from which the water is to be raised. When the piston is drawn up from the bottom of the barrel the air below is rarefied, and the pressure of the external air acting on the surface of the water in the well, causes the water to rise in the suction-tube until the equilibrium is restored. After a few strokes the water will get into the barrel, the air below the piston

having escaped through the piston-valve *e*. By continuing the strokes the water will get above the piston, and be raised along with it to the cistern *d*, at the top of the barrel, where it is discharged by a spout. In this pump the water should rise after the piston to the height of about 33 feet above the level of the water in the well, a column of about 33 feet of water being a balance for the pressure of the atmosphere, but practically there is great difficulty in making the apparatus perfectly air-tight, and with pumps of the ordinary construction a height above 28 feet is seldom reached. The water which gets above the piston may be raised to any convenient height. The *lift-pump* has also two valves and a piston, both open-

ing upwards; but the valve in the cylinder, instead of being placed at the bottom of the barrel, is placed in the body of it, and at the height where the water is intended to be delivered. The bottom of the pump is thrust into the well a considerable way, and if the piston is supposed to be at the bottom, it is plain that as its valve opens upwards, there will be no obstruction to the water rising in the cylinder to its height in the well. When, therefore, the piston is raised, its valve will shut, and the water in the cylinder will be lifted up; the valve in the barrel will be opened, and the water will pass through it, and cannot return, as the valve opens upwards; another stroke of the piston repeats the same process, and in this way the water is raised from the well. The *force-pump* differs from both these in having its piston solid, or without a valve, and also in having a side pipe with a valve opening outwards, through which the water is forced to any height required, or against any pressure that may oppose it. In such pumps the *plunger* is frequently employed instead of the ordinary piston; this arrangement is represented in the above engraving, which is a section of the feed-pump of a steam-engine. The plunger *a* works air-tight through a stuffing-box *b* at the top of the barrel, and on being raised produces a vacuum in the pump-barrel into which the water rushes by the pipe *c*, and is discharged, on the descent of the plunger through the pipe *d*, the valves *e* and *f* serving to intercept the return of the water at each stroke. The side pipe *d*, however, requires the addition of an air-vessel. The *chain-pump* is described under a separate heading. The *centrifugal* or *rotary pump* consists of a fan-shaped wheel having passages leading from its centre to its circumference, and a casing in which the wheel is made to move very rapidly. Its circumference communicates with a delivery pipe, and its centre with a pipe leading to the water which is to be pumped.

Putrefaction (pü-trë-fak'shon), *n.* [See **PUTREFY**.] 1. The act or process of putrefying; the decomposition of animal and vegetable substances, attended by the evolution of foetid gases. By this process such substances are reduced either to much more simple compounds, or to their original separate elements. The putrefaction, or putrefactive fermentation of animal substances, is usually attended by more foetid and noxious exhalations than those arising from vegetable products, arising chiefly from the more abundant presence of nitrogen in the former. The formation of ammonia, or of ammoniacal compounds, is a characteristic of most cases of animal putrefaction, while other combinations of hydrogen are also formed, especially carburetted hydrogen, together with complicated and often highly infectious vapours or gases, in which sulphur and phosphorus are frequently discerned. These putrefactive effluvia are for the most part easily decomposed or rendered innocuous by the agency of chlorine; hence the importance of that substance as a powerful and rapidly acting disinfectant. The rapidity of putrefaction and the nature of its products are to a great extent influenced by temperature, moisture, and access of air. A temperature between 60° and 80°, a due degree of humidity and free access of air, are the circumstances under which it proceeds most rapidly. Hence the abstraction of the air and moisture, or the influence of cold, salt, sugar, spices, &c., will counteract the process of putrefaction by keeping away or preventing the development of the germs floating in the air which seem the most efficient agents of decomposition. A solid structure of a well-known shape, erected in different parts of the world, the most noted being those of Egypt and Mexico, the name being more exclusively and properly adopted for the former. The pyramids of Egypt commence immediately south of Cairo, continuing southwards at varying intervals for nearly 70 miles. The four largest are near Ghizeh, a village

about 4 miles south-west of Cairo. As the pyramids are all built on the same principle, a description of the principal one, named the Great Pyramid, or Pyramid of Cheops, may serve for all. Its base forms a square, each side of which was originally 764 feet, though now, by the removal of a coating, only 746 feet long, occupying 13 acres. It is built in platforms successively diminishing till that at the top contains only 1067 square feet. The height, according to Wilkinson, was originally 480 feet 9 inches, present height 460 feet, and the series of platforms present a succession of 203 steps, up which the ascent is made. The interior, entered 49 feet above the base of the north face, contains numerous chambers, one of which, called the King's Chamber, is 34½ feet long, 17 wide, and 19 high, and contains a sarcophagus of red granite. The whole structure, unquestionably the most stupendous stone building ever put together by the hand of man, is said by Herodotus to have employed 100,000 men for 20 years, and its solid contents have been computed at 82,111,000 cubic feet. The pyramids are supposed to have been raised over the sepulchral chambers of the ancient Egyptian kings, the first act of a monarch being to prepare his 'eternal abode.'

The *Pyramids* themselves, dotting with age, have forgotten the names of their founders. *Fuller*.

This point is called the vertex of the pyramid; and the planes which meet in the vertex are called the sides, which are necessarily all triangles, having for their bases the sides of the base of the pyramid. Every pyramid is one-third of a prism that has the same base and altitude as the pyramid. Pyramids are denominated from the figures of their bases, being triangular, square, pentagonal, &c., according as the base is a triangle, a square, a pentagon, &c.—3. The actual amount of heat absorbed by the instrument is calculated by ordinary calorimetric means; the area of the exposed blackened surface is known, and the amount of water or mercury which has been raised through a certain number of thermometric degrees is known, and thus

the absolute heating effect of the sun, acting upon a given area under the conditions of the experiment, can be readily found.

Q.

Q is the seventeenth letter of the English alphabet, a consonant having the same sound as *k* or hard *c*. It is a superfluous letter in English, as the combination *qu*, in which it always occurs, could be equally well expressed by *kw*, or *k* alone when the *u* is silent. It did not occur in the Anglo-Saxon alphabet, the sound *qu* in Anglo-Saxon words being regularly written *cw* or *cu*, but was borrowed from the French-Latin alphabet. In Latin, as in English, this letter never occurred unless followed by *u*. It is now used in purely English words as well as in those derived from the French or taken directly from the Latin. It is most common as an initial letter; it never stands alone as a final, though in such words as *pique*, *oblique* it is really final, the following vowels being then silent. In *queen*, *quenah*, *qu* corresponds to the A. Sax. *cu*; in *quadrangle*, &c., to the Latin *qu*; in *squire* it represents a former *cu*, while *quire* is a much modified form of *choir*. The name of the letter is said to be from the Fr. *queue*, a tail, the form being that of an O with a tail added.—Among *mathematicians*, **Q**, *E. D.* stand for *quod erat demonstrandum*, which was to be demonstrated; *Q. E. F.* *quod erat faciendum*, which was to be done.—In *Rom. literature and inscriptions*, **Q** stands for *Quintus*.

of a figure to a square. Thus the finding of a square which shall contain just as much area as a circle or a triangle, is the *quadrature* of that circle or triangle. The quadrature of the circle is a problem of great celebrity in the history of mathematical science. The whole circular area being equal to the rectangle under the radius and a straight line equal to half the circumference, the quadrature would be obtained if the length of the circumference were assigned; and hence the particular object aimed at in attempting to square the circle is the determination of the ratio of the circumference to the diameter. This ratio can only be expressed by an infinite series, and the squaring of the circle is still an unsolved problem. 2. A quadrant; a square space. [Rare.]

All A is B,
Some A is B,
to write
All (or some) A is all (or some) B. *Latham*.

The *quantification* of the predicate belongs in part to Sir William Hamilton; viz., in its extension to negative propositions. De Quincy.

Quantity (kwon'ti-ti), *n.* [Fr. *quantité*, L. *quantitas*, quantity, extent, from *quantis*, how great, from *quam*, to what a degree.] 1. That property in virtue of which a thing is measurable; greatness; extent; measure; size.

Quantity ought to be defined, *what may be measured*. Those who have defined quantity to be *whatever is capable of more or less*, have given too wide a notion of it, which, it is apprehended, has led some persons to apply mathematical reasoning to subjects that do not admit of it. Pain and pleasure admit of various degrees, but who can pretend to measure them? . . . There are some quantities which may be called *proper*, and others *improper*.

That property is quantity which is measured by its own kind, or which, of its own nature, is capable of being doubled or tripled, without taking in any quantity of a different kind as a measure of it. *Improper quantity* is that which cannot be measured by its own kind, but to which we assign a measure by the means of some proper quantity that is related to it. Thus velocity of motion, when we consider it by itself, cannot be measured (we measure it by the space passed in a given time). *Reid*.

Quantity is distinguished into *continued* and *discrete*. See under DISCRETE.—2. Any amount, bulk, or aggregate in a concrete sense; as, a quantity of earth, a quantity of water, a quantity of air, of light, of heat, of iron, of wood, of timber, of corn, of paper. But we do not say, a quantity of men, or of horses, or of houses; for as these are considered as separate individuals or beings, we call an assemblage of them, a *number* or *multitude*. Hence, often a large or considerable amount; a large bulk or sum. 'Warm antiscorbutic plants taken in quantities.' *Arbuthnot*. 'The quantity of extensive and curious information which he had picked up during many months of desultory but not unprofitable study.' *Macaulay*.—3. † A portion or part, especially a small portion; anything very little or diminutive.

4. † Proportion; correspondent degree.

Love can transpoise to form and dignity. *Shak.*

5. In *math.* anything which can be multiplied, divided, or measured; anything to which mathematical processes are applicable. In algebra, quantities are *known* and *unknown*. *Known quantities* are usually represented by the first letters of the alphabet, as *a, b, c*, and *unknown quantities* are expressed by the last letters, *x, y, z*, &c. Letters thus used to represent quantities are themselves called quantities. A simple quantity is expressed by one term, as *a*, or *-abc*; a compound is expressed by more terms than one, connected by the signs *+*, *-*, or *-*, as *a + b*, or *a - b + a*. Quantities which have the sign *+* prefixed are called *positive* or *affirmative*; those which have the sign *-* prefixed are called *negative*. *Similar quantities* are such as consist of the same letters, and the same powers of the letters, as *abc*, *-3abc*, *4-6abc*, *-9abc*. *Unlike* or *dissimilar quantities* are those which consist of different combinations of letters, as *ab*, *ab²*, *3abc*, *4xy*, &c.—*Constant* and *variable quantities*. See under CONSTANT, *a.*, and also *Variation of constants* under CONSTANT, *n.*—*Real quantities*, those which do not involve any operation impossible to be performed, such as the extraction of an even root of a negative quantity.—*Imaginary quantity*. See under IMAGINARY.—*Rational* and *irrational quantities*. See under RATIONAL.—6. In *gram.* the measure of a syllable or the time in

7. In *logic*, a category, universal, or predicament; a general conception; also, the extent in which the subject of a proposition is taken, whether to stand for the whole, or only a part of its significates.

Another division of propositions is according to their quantity (or extent). If the predicate is said of the whole of the subject, the proposition is *universal*. If of part of it only, the proposition is *particular* (or partial); e.g., 'Britain is an island'; 'all tyrants are miserable'; 'no miser is rich'; are *universal* propositions, and their subjects are therefore said to be *distributed*, being understood to stand, each for the whole of its significates; but 'some islands are fertile'; 'all tyrants are not assassinated'; are *particular*, and their subjects consequently not *distributed*, being taken to stand for a *part* only of their significates. *Whately*.

—Quantity of estate, in *law*, the time during which the right of enjoyment of an estate continues.—Quantity of matter, in a body, is the measure arising from the joint consideration of its magnitude and density. See MASS.—Quantity of motion, in a body, is used synonymously with *momentum* to denote the product of the quantity of matter in the moving body by its velocity.—Quantity and *intensity*, terms employed by Mr. James Mill in his *Elements of the Human Mind*, as correlative; the Latin term, *quantus*, how much, being answered by *tantus*, so much.

The doctrine of *quantivalence* is, in strictness, only applicable in the case of gaseous elements and compounds, bodies whose molecular weight can be estimated by their vapours obeying Avogadro's law of volumes, viz., that the molecule of an element or compound is that weight of the body which occupies in the gaseous state the volume of hydrogen gas weighing the *quantivalence* of an element being determined by the number of atoms of hydrogen or of chlorine, or other distinctly monad element or radical, which it may be able to take up in this molecular volume. By an extension of this reasoning, we term potassium a monad and barium a dyad metal, because we find that they each form only one compound with chlorine, potassium combining with one atom and barium with two. *Nature*.

Quantum (kwan'tum), *n.* [L.] A quantity; an amount. 'Without authenticating the value or the quantum of the charges,' *Burke*.—*Quantum meruit*, as much as he has deserved. The side who has the quoit nearest the hob counts a point towards game, or if the quoit is thrown so as to surround the hob, it counts two. The game only slightly resembles the ancient one of throwing the discus, which has, however, been often translated by this English word.

R.

R is the eighteenth letter of the English alphabet, classed as a liquid and semi-vowel. In the pronunciation of Englishmen generally it represents two somewhat different sounds. The one heard at the beginning of words and syllables, and when it is preceded by a consonant, is produced by an expulsion of vocalized breath, the tongue almost touching the palate behind the front teeth, with a slightly tremulous motion; the other, less decidedly consonantal, heard at the end of words and syllables, and when it is followed by a consonant, formed by a vibration of the lower part of the tongue, near the root, against the soft palate. In the pronunciation of many English speakers, *r*, followed by a consonant at the end of a syllable, is scarcely heard as a separate sound, having merely the effect of lengthening the preceding vowel; when it is itself final, as in *bear*, *door*, *their*, &c., it becomes a vowel rather than a consonant. In some of the dialects, and notably in Scotch, no such pronunciations of *r* are heard, the letter having always the same sound, and being uttered with a very strong vibration of the point of the tongue, much as in French or German, though less guttural. Among the Romans *r* was called 'the dog's letter' (*littera canina*), from its sound being compared to the snarling of a dog; as Ben Jonson says, 'R is the dog's letter and hurreth in *l*, sound.' *R* has very close affinities with *l*, and its interchange with that consonant is common. (See *L*.) It is also closely allied to *s* (with the *z*-sound); and thus we find the latter changing to *r*, as exemplified by A. Sax. *isen*, E. *iron*, A. Sax. *freesan*, E. *freeze* and adjective *freore*, A. Sax. *cedsan*, to choose, *coren*, chosen, Goth. *auso* = E. *ear* (*L. auris*). It has intruded itself into some words to which it does not pro-

perly belong, as into *hoarse*, *cartridge*, *partridge*, *corporal*, *culprit*. In *celery* it represents an original *n* (Gr. *selinon*). It is a common sound at the beginning of syllables preceded by *b*, *c*, *d*, *f*, *g*, *p*, and *t*, and at the end of syllables followed by these letters, as also by *l*, *m*, *n*, *s*. In words which we have received from the Greek language we follow the Latins, who wrote *h* after *r*, as the representative of the aspirated sound with which this letter was pronounced by the Greeks. But as the letter is not aspirated in English *h* is entirely superfluous, *rhapsody*, *rheum*, *rhetoric* being pronounced as if written *hapsody*, *reum*, *retoric*.—As an abbreviation *R* in English stands for *rex*, king; as, George R.; or for *regina*, queen; as, Victoria R.; also for *royal*; as, R. N., Royal Navy; R. A., Royal Academy or Academician.—Among physicians *R* or *R* stands for *recipe*, take.—The three *Rs*, a humorous and familiar designation for *Reading*, *Writing*, and *Arithmetic*. It originated with Sir William Curtis, who, on being asked to give a toast, said, 'I will give you the three *Rs*, *Writing*, *Reading*, and *Arithmetic*.'

The divergence or shooting forth of anything from a point or surface, like the diverging rays of light; as, the *radiation* of heat, of sound, &c. The intensity of the radiation of heat varies with the nature of the radiating body, and the state of its surface with regard to polish, colour, source of heat, &c. Its intensity in a vacuum is inversely as the square of the distance from the radiating point.—*Solar radiation*, the heat which the earth receives from the sun.—*Terrestrial radiation*, the heat which escapes from the earth into the regions of space.

The term is sometimes extended to all quantities under the radical sign.—*Radical sign*, the sign $\sqrt{\quad}$ (a modified form of the letter *r*, the initial of L. *radix*, root) placed before any quantity, denoting that its root is to be extracted; thus, \sqrt{a} or $\sqrt{a+b}$. To distinguish the particular root a number is written over the sign; thus, $\sqrt[3]{\quad}$, $\sqrt[4]{\quad}$, &c., denote respectively the square root, cube root, fourth root, &c. In the case of the square root, however, the number is usually omitted, and merely the sign written.

3. In *chem.* a term used in its broadest sense to designate all substances, simple or compound, which combine with any of the more electro-negative elements to form compounds either acid, neutral, or basic; but more generally and narrowly, applied only to compounds of elements, as ammonium and cyanogen, which have themselves an elementoid nature, and perform elemental functions. The alcohols and ethers and other important classes of organic compounds were at one time almost universally regarded as containing certain compound elementoid groups of carbon and hydrogen atoms called methyl, ethyl, propyl, butyl, &c. At present another radical is supposed by many to be contained in the alcohols, called hydroxyl (HO), and many do not regard the existence of the former series as essential.

The marine Radiolaria all inhabit the superficial stratum of the sea, and fabricate their skeletons at the expense of the infinitesimally small proportion of silicic acid which is dissolved in sea-water. When they die these skeletons sink to the bottom, forming geological strata. Extensive masses of tertiary rock, such as that which is found at Oran, and that which occurs at Bissex Hill in Barbadoes, are very largely made up of exquisitely preserved skeletons of Radiolaria, which are erroneously named 'fossil Infusoria.' But though there can be little doubt that Radiolaria abounded in the cretaceous sea, none are found in the chalk, their siliceous skeletons having probably been dissolved and redeposited as flint.

Railroad (räl'röd), *n.* See **RAILWAY**. [This word is less common in England than *railway*, but is the term generally used in America.]

Railway (räl'wä), *n.* [*Rail* and *way*.]
1. A road or way having parallel iron or steel rails along it, on which the wheels of carriages are made to run in order to lessen friction. These rails were originally formed of wooden beams, and the wheels of the wagons had flanges on one side of the periphery, which confined them to the tracks. The wooden rails were succeeded by iron plates, called *plate-rails*, with flanges or upturned ledges along one side, to prevent the wheels leaving them. The modern railway consists of one or more series of pairs of iron or steel bars, called *edge-rails*, laid parallel to each other, and several feet apart. The width between the rails is called the *gauge*. The *narrow gauge* measures 4 feet 8½ inches between the rails; the *broad gauge* (now given up) 7 feet. The narrow is the national gauge of Great Britain, and over the greater part of Europe. A pair of parallel rails constitutes a *single line* of railway, two pairs a *double line*, and so on. The rails are supported at a little height above the general surface by iron pedestals called *chairs*, which again are firmly fixed to wooden or iron supports called *sleepers*, placed at intervals and embedded in the material of the roadway. (See **RAIL**, **CHAIR**, **SLEEPER**.) A railway, in general, approaches as nearly to a straight line between its two extremes as the nature of the country and the necessities of the intermediate traffic will permit. It is carried over valleys, either by *embankments* or *viaducts*, and through hills or elevated ground by deep

trenches called *cuttings*, or by tunnels. In favourable cases the surface line of the railway is so adjusted that the materials excavated from the cuttings will just serve to form the embankments. Such a line is termed a *balancing line*. Should the excavated material be in excess it is termed *spoil*, and deposited in a convenient place, where it forms a *spoil bank*; but should it be in too small quantity to form the embankment, recourse is had to an excavation along the sides of the site of the latter to supply the deficiency. This is termed *side cutting*. The balancing line or surface line of the railway may or may not be level, and its various slopes are termed *gradients*, and the arrangement of the rises and falls is termed the *grading* of the line. A more or less steep ascent is termed an *incline*. When the line is formed its surface is covered with broken stones or clean gravel called *ballasting*, and in this the wooden *sleepers*, or stone blocks for sustaining the rails, are embedded. The sleepers are laid across the roadway about 3 feet apart from centre to centre, and to them the chairs which sustain the rails are spiked. Sometimes longitudinal wooden sleepers are used along with the transverse sleepers. These consist of beams laid under the rails and secured to the transverse sleepers. When such are used chairs are frequently dispensed with, the rails being formed with a flange at bottom which is fastened directly to the wooden beam. When the railway is thus completed, the work is called the *permanent way*. In the railway of a single line of rail, it is necessary to make provision for permitting meeting carriages to pass each other by means of *sidings*, which are short additional railways laid at the side of the main line, and so connected with it at each extremity that a carriage can pass into the siding in place of proceeding along the main line. In double lines, in addition to sidings, which are in them also required, it is necessary to provide for carriages crossing from one line to another. The change in the direction of the carriage, in both cases, is effected by switches and turn-tables. The annexed cut shows a system of rails arranged for the junction of one double line of rails with another, and known as a *main-line junction*. The various places along the line

See **SWITCH**.

of railway, where carriages stop for taking up or depositing goods or passengers, are termed *stations*, with the prefix of *goods* or *passenger*, as they are allotted to the one or the other; the stations at the extremities of a railway are called *termini*. Steam

power is usually employed in moving the carriages or wagons by means of a *locomotive engine*, that is, a steam-engine mounted on a framework, with wheels made to run upon the rails. By its weight and the friction of its wheels on the rails a tractive force is provided by which it is enabled to move at a high rate of velocity, and to drag great loads after it. In some particular cases a fixed engine is employed to give motion to a rope by which the carriages are dragged along, the rope being either an endless rope stretched over pulleys, or one which winds and unwinds on a cylinder. Such engines are termed *stationary engines*, and are used chiefly on inclined planes, where the ascent is too steep for the locomotive engine. In some cases the carriages are impelled by atmospheric pressure. See *Atmospheric Railway* under *ATMOSPHERIC*. 2. In an extended sense, all the land, works, buildings, and machinery required for the support and use of the road or way, with its rails.

Rain (rān), [*A. Sax. regn, rēn; cog. Icel. Dan. and Sw. regn; D. and G. regen; Goth. rign; same root as L. rigare, whence irrigate.* As to the disappearance of *g* compare *rail, hail, fail*.] 1. The descent of water in drops from the clouds; or the water thus falling. Rain depends upon the formation and dissolution of clouds. The invisible aqueous vapour suspended in the atmosphere, which forms clouds, and is deposited in rain, is derived from the evaporation of water, partly from land, but chiefly from the vast expanse of the ocean. At a given temperature the atmosphere is capable of containing no more than a certain quantity of aqueous vapour, and when this quantity is present the air is said to be saturated. Air may at any time be brought to a state of saturation by a reduction of its temperature, and if cooled below a certain point the whole of the vapour can no longer be held in suspension, but a part of it condensed from the gaseous to the liquid state will be deposited in dew or float about in the form of clouds. If the temperature continues to decrease, the vesicles of vapour composing the cloud will increase in number and begin to descend by their own weight. The largest of these falling fastest will unite with the smaller ones they encounter during their descent, and thus drops of rain will be formed of a size that depends on the thickness, density, and elevation of the cloud. The point to which the temperature of the air must be reduced in order to cause a portion of its vapour to form clouds or dew is called the dew-point. It is considered that an inch of rain on an acre gives above 101 tons of water. The average rainfall in a year at any given place depends on a great variety of circumstances, as latitude, proximity to the sea, elevation of the region, configuration of the country and mountain ranges, exposure to the prevailing winds, &c. Various prefixes applied to the name rain indicate the nature of various substances which fall on the earth's surface. Thus *blood-rain* is formed by a shower of lower plants or algae of red colour, and *sulphur-rain* or *yellow-rain* results from the pollen of fir-trees being blown in immense showers by the wind.—2. A shower or pouring down of anything.

The fair from high the passing pomp beheld;
A rain of flowers is from the windows roll'd.
Dryden.

Its colour is soft brown-gray upon the back, dullish yellow on the under part of the body, and rusty red upon the wings. The tail is beautifully barred with black and white. Its wings are rather short and weak, so that it does not fly to any great distance when alarmed, but flits to a branch a few yards in advance and turns round to look at the intruder. It feeds on large caterpillars, locusts, spiders, mice, and lizards. It is sometimes called *Tom Fool*, because, in order to gratify its curiosity, it will sit still and allow itself to be struck from its perch.

Rainbow (rān'bō), *n.* A bow, or an arc of a circle, consisting of all the prismatic colours, formed by the refraction and reflection of rays of light from drops of rain or vapour, appearing in the part of the heavens opposite to the sun. When the sun is at the horizon the rainbow is a semicircle. When perfect the rainbow presents the appearance of two concentric arches; the inner being called the *primary*, and the outer the *secondary* rainbow. Each is formed of the colours of the solar spectrum, but the colours are arranged in the reversed order, the red forming the exterior ring of the primary bow, and the interior of the secondary. The primary bow is formed by the sun's rays entering the upper part of the falling drops of rain, and undergoing two refractions and one reflection; and the secondary, by the sun's rays entering the under part of the drops, and undergoing two refractions and two reflections. Hence, the colours of the secondary bow are fainter than those of the primary. The moon sometimes forms a bow or arch of light, more faint than that formed by the sun, and called a *lunar rainbow*.—*Spurious or supernumerary rainbow*, a bow always seen in connection with a fine rainbow, lying close inside the violet of the primary bow, or outside that of the secondary one. Its colours are fainter and more impure, as they proceed from the principal bow, and finally merge into the diffused white light of the primary bow, and outside the secondary.

Rain-gauge (rān'gāj), *n.* An instrument for measuring or gauging the quantity of rain which falls at a given place. Rain-gauges are variously constructed. One convenient form consists of a cylindrical tube of copper,

with a funnel at the top where the rain enters. Connected with the cylinder at the lower part is a glass tube with an attached scale. The water which enters the funnel stands at the same height in the cylinder and glass tube, and being visible in the latter the height is read immediately on the scale, and the cylinder and tube being constructed so that the sum of the areas of their sections is a given part, for instance a tenth of the area of the funnel at its orifice, each inch of water in the tube is equivalent to the tenth of an inch of water entering the mouth of the funnel. A stop-cock is added for drawing off the water. As, however, the glass tube frequently gets broken, or bursts during frost, a still simpler gauge has been proposed. This consists of a funnel having a diameter of 4.697 inches, or an area of 17.33 inches. Now as a fluid ounce contains 1.783 cubic inches, it follows that for every fluid ounce collected by this gauge the tenth of an inch of rain has fallen.

The prints of rain-drops may be well seen on a muddy or sandy sea-beach after a heavy shower. It is possible for the geologist to tell by scrutinizing the prints from what direction the old wind was blowing when it blew the rain-drops against the then soft clay.

Ratio (*rā'shi-ō*), *n.* [*L. ratio, rationis*, a reckoning, calculation, from *reor, ratus*, to think or suppose, to set, confirm, or establish. *Reason, ration* are the same word under different forms. See REASON.] 1. *Lit.* reason; cause.—2. Relation or proportion which one thing has to another in respect of magnitude or quantity; or, in a narrower sense, the numerical measure which one quantity bears to another of the same kind, expressed by the number found by dividing the one by the other. The ratio of one quantity to another is by some mathematicians regarded as the quotient obtained by dividing the second quantity by the first; by others, as the quotient obtained by dividing the first by the second; thus the ratio of 2 to 4 or *a* to *b* may be called either

$\frac{2}{4}$ and $\frac{a}{b}$ or $\frac{4}{2}$ and $\frac{b}{a}$. Proportion, in the mathematical sense, has to do with the comparison of ratios. Thus 3 has to 4 a certain ratio, and so has 6 to 8; and the expression 3 is to 4 in the same proportion as 6 to 8, denotes that the ratios of 3 to 4 and 6 to 8 are equal, 3 being the same proportion of 4 as 6 is of 8, that is, three-fourths. Ratio in the above sense is sometimes called *geometrical ratio*, in opposition to *arithmetical ratio* or the difference between two quantities.—*Compound ratio*.

When one quantity is connected with two others in such a manner that if the first be increased or diminished the product of the other two is increased or diminished in the same proportion, then the first quantity is said to be in the *compound ratio* of the other two. Thus the momentum of a moving body is in the *compound ratio* of the quantity of matter and the velocity.—*Direct ratio*. When two quantities or magnitudes have a certain ratio to each other, and are at the same time subject to increase or diminution, if while one increases the other increases in the same ratio, or if while one diminishes the other diminishes in the same ratio, the proportions or comparisons of ratios remain unaltered, and those quantities or magnitudes are said to be in a *direct ratio* or proportion to each other. Thus in uniform motion the space is in the *direct ratio* of the time.—*Inverse ratio*. When two quantities or magnitudes are such that when one increases the other necessarily diminishes, and vice versa when the one diminishes the other increases, the ratio or proportion is said to be *inverse*. Thus in uniform motion the time is in the *inverse ratio* of the velocity.—*Duplicate ratio*. When three quantities are in continued proportion the first is said to have to the third the *duplicate ratio* of that which it has to the second, or the first is to the third as the square of the first to the square of the second. Also, when any number of quantities are in continued proportion the ratio of the first to the last is said to be compounded of the several intermediate ratios.—*Mixed ratio*. See under MIXED.—*Prime and ultimate ratios*, terms first introduced, at least in a system, by Newton, who preferred them to the terms suggested by his own method of fluxions. The method of prime and ultimate ratios is a method of calculation which may be considered as an extension of the ancient method of exhaustions. It may be thus explained:—Let there be two variable quantities constantly approaching each other in value, so that their ratio or quotient continually approaches to unity, and at last differs from unity by less than any assignable quantity, the *ultimate ratio* of these two quantities is said to be a ratio of equality. In general, when different variable quantities respectively and simultaneously approach other quantities, considered as invariable, so that the differences between the variable and invariable quantities become at the same time less than any assignable quantity, the *ultimate ratios* of the variables are the ratios of the invariable quantities or limits to which they continually and simultaneously approach. They are called *prime ratios* or *ultimate ratios* according as the ratios of the variables are considered as receding from or approaching to the ratios of the limits. The first section of Newton's *Principia* contains the development of *prime and ultimate ratios*, with various propositions.—*Extreme and mean ratio*. See under EXTREME.—*Composition of ratios*, the uniting of two or more simple ratios into one, by taking the product of the antecedents and the product of the con-

sequents.—3. In law, an account; a cause, or the giving judgment therein.

Rational (*rash'on-al*), *a.* [Fr. *rationnel*; *L. rationalis*, from *ratio, rationis*, proportion. See RATIO.] 1. Having reason or the faculty of reasoning; endowed with reason; opposed to *irrational*; as, man is a *rational* being; brutes are not *rational* animals.

In *arith.* and *alg.* a term applied to an expression in finite terms; or, one on which no extraction of a root is left, or, at least, none such indicated which cannot be actually performed by known processes. The contraries of these are called *surd* or *irrational* quantities. Thus $2, 9, 12\frac{1}{2}$ are rational quantities, and $\sqrt{2}, \sqrt[3]{4}, \&c.$, are irrational or surd quantities, because their values can only be approximately and not accurately assigned. See SURD.—*Rational dress*, a dress for women regarded as more suitable than that of the ordinary type, especially one in some respects resembling male attire.—*Rational horizon*. Rationalism (*rash'on-al-izm*), *n.* 1. Adherence to the dictates of reason; acceptance of one's own reason as guide.—2. In *metaph.* the doctrine which affirms that reason furnishes certain elements without which experience teaches nothing, as opposed to *empiricism*, which refers all our knowledge to sensation and reflection, or experience.—3. In *theol.* a system of opinions deduced from reason, and borrowing nothing from revelation or inspiration, or opposed to it; the system which subjects all religious doctrines or teachings to the test of reason and rejects supernaturalism; the interpretation of Scripture upon principles of human reason alone. From the middle of the eighteenth century German and other writers have endeavoured either to affix

a lower and more human character to the invisible operations of God upon men through Christianity, or to reduce the accounts which we have of the foundation of our religion to the mixture of truth and error natural to fallible men. They have questioned the genuineness of almost all the separate parts of Scripture, and the accuracy of all their supernatural narratives. Various writers of the later rationalistic school, sometimes known as the mythical school, regard the gospel records as assertions of floating myth round a nucleus of historical fact.

This principle, which vindicates the prerogative of reason to apply itself to the interior, as well as to the exterior, of revelation, is properly described by the word *Rationalism*: and constitutes the *only essential feature* of the German system. The other chief peculiarity of the Rationalist interpreters—by which almost exclusively, from its startling character, they are known in this country—their antisupe-
rnatism, is no necessary part of their system, but an accidental accretion, hastily attached to it in the exaggerating spirit of a new theory. It is an illogical and mischievous application of the principle of *rationalism*, for which that principle itself refuses to be responsible. That no external testimony can establish a fact or a doctrine intrinsically absurd and incredible, is a sound canon of evidence; that a miracle is a thing thus absurd and incredible is a false and rash assumption—an assumption for which no ingenuity has ever been able to procure the sanction of philosophy. Were it true, *Rationalism* and *Deism* would mean the same thing. *James Martineau.*

Rationalist (rash'on-al-ist), *n.* 1. An adherent of rationalism; one who is guided in belief and practice wholly by reason.

The empirical philosophers are like pismires; they also lay up and use their store. The *rationalists* are like the spiders: they spin all out of their own bowels. But give me a philosopher who, like the bee, has a middle faculty, gathering from abroad, but digesting that which is gathered by his own virtue. *Bacon.*

2. In *theol.* one who considers the supernatural events recorded in the Old and New Testaments as events happening in the ordinary course of nature, but described by the writers, without any real ground, as supernatural; and who considers the morality of the Scriptures as subject to the test of human reason. Sometimes used adjectively. '*Rationalist interpreters.*' *James Martineau.*

Rationalistic, Rationalistical (rash'on-al-ist'ik, rash'on-al-ist'ik-al), *a.* Relating to or accordant with rationalism.

If we believe that God rules, if we believe that Christ rose, if we have reason to hold among the deepest convictions of our being the certainty that God has not delegated His sovereignty or His providence to the final, unintelligent, pitiless, inevitable working of material forces, . . . then we shall neither clutch at *rationalistic* interpretations nor be much troubled if others adopt them. *Farrar.*

Rationalize, Rationalise (rash'on-al-iz), *v.i.* To act or interpret as a rationalist; to be guided by or conform to the principles of rationalism; to judge or estimate matters in accordance with the principles of rationalism.

To *rationalize* is to ask improperly how we are to account for certain things, to be unwilling to believe them unless they can be accounted for, that is, referred to something else as a cause, to some existing system, as harmonizing with them or taking them up into itself. . . . Rationalism is characterized by two peculiarities, its love of systematizing, and its basing its system upon personal experience or the evidence of sense. *J. H. Newman.*

Reaping-machine (rēp'ing-ma-shēn'), *n.* A machine for cutting down standing corn, &c. The usual construction now consists of a drawing-wheel fixed to one side of the frame, to which is attached a spur-wheel gearing into a series of small toothed wheels which increase the slow speed of the periphery of the main wheel to the fast motion necessary for driving the cutting knives. These knives generally consist of triangular pieces of steel riveted to an iron bar, and are sometimes smooth and sometimes toothed. The knife-bar is attached to a crank by a connecting-rod, and this crank, which makes about 700 revolutions per minute, receives its accelerated motion through a train of wheels in direct communication with the large driving-wheel, which moves as the machine is drawn over the field by horse-power. The knife-bar moves backwards and forwards on guides fixed at the back of a number of pointed fingers, which enter the standing grain and guide the straw to the edges of the knives. A platform is fixed behind the cutter bar, which receives the corn as it falls from the knives. In most cases a revolving rake with four inclined arms is attached to such machines, and set in motion by the driving-wheel. Two of the arms bring the corn well on to the knife, and the others deliver the corn cut at the back of the machine. Many of the recent machines are also fitted with a binding apparatus. An endless apron receives the grain as it is cut, and deposits it in a trough on the outer side of the machine. By an ingenious mechanical arrangement the loose straw is caught and compressed by two iron arms; wire from a reel is passed round the sheaf, fastened by twisting, cut away, and the bound sheaf is tossed out of the trough by one of the arms by which it was compressed. Other apparatus are constructed so as to bind with cord, straw rope, &c.

And be ready always to give an answer to every man that asketh you a reason of the hope that is in you. *1 Pet. iii. 15.*

3. A faculty of the mind by which it distinguishes truth from falsehood, and which enables the possessor to deduce inferences from facts or from propositions, and to combine means for the attainment of particular ends. Reason is the highest faculty of the human mind, by which man is distinguished from brutes, and which enables him to contemplate things spiritual as well as material, to weigh all that can be said or thought for and against them, and hence to draw conclusions and to act accordingly. A man may therefore be said to possess reason in proportion as he actually exercises that power, that is, reasons and acts according to the conclusions or results at which he has arrived. In the language of English philosophy the terms reason and understanding are sometimes nearly identical, and are so used by Stewart; but in the critical philosophy of Kant a broad distinction is drawn between them.

Reason has been employed to denote our intelligent nature in general, as distinguished from the lower cognitive faculties, as sense, imagination, and memory; and in contrast to the feelings and desires, including (1) Conception; (2) Judgment; (3) Reasoning; (4) Intelligence. *Sir W. Hamilton.*

The faculty of thought manifests itself both as *understanding* and *reason*. By the *understanding* we inquire after and investigate the grounds, causes, and conditions of our representations, feelings, and desires, and of those objects standing in immediate connection with them; by *reason* we inquire after the ultimate grounds, causes, and conditions. By the *understanding* we evolve rules for the regulation of our desiring faculty; by *reason* we subordinate these rules to a higher law, to a law which determines the unconditioned form, the highest end of acting.

Through the power of thought, therefore, our knowledge, both theoretical and practical, is comprehended in unity, connection, and in being. *Trans. of Transcendental.*

In the philosophy of Kant the *understanding* is distinguished from the *reason*—1. By the sphere of their action. The sphere of the *understanding* is coincident with the *sensible* world, and cannot transcend it; but the *reason* ascends to the *supersensible*.—2. By the objects and result of their exercise. The *understanding* deals with *conceptions*, the *reason* with *ideas*. The knowledge obtained by the *understanding* is particular and contingent, the product of the *reason* is necessary and universal knowledge or truth. *Fichte.*

5. In logic, the premises or premises of an argument, especially the minor premiss; and it is from reason in this latter sense that the word *reasoning* is derived. *Whately.*

6. What is conformable to or in accordance with the rational faculty duly exercised; what men in general would say was right; as, to listen to reason. *Shak.* Hence, specifically, (a) right; justice; equity; fairness; that which is dictated or supported by reason.

three arms radiating from the centre at angular distances of 120° apart, each provided with a vernier, so that each angle measured is derived from the mean of three readings at opposite points of the arc. Reflectingly (rĕ-flekt'ing-li), *adv.* 1. With reflection.—2. With censure; reproachfully; censoriously.

Reflection (rĕ-flek'shon), *n.* 1. The act of reflecting, or the state of being reflected; specifically, in physics, the change of direction which a ray of light, radiant heat, sound, or other form of radiant energy, experiences when it strikes upon a surface and is thrown back into the same medium from which it approached. When a perfectly elastic body strikes a hard and fixed plane obliquely it rebounds from it, making the angle of reflection equal to the angle of incidence. (See **INCIDENCE**.) In the annexed figure let DE represent a smooth polished surface or mirror, and suppose a ray of light proceeding in the direction AB

to impinge on the surface at B, and to be reflected from it in the direction BC. From B draw BH perpendicular to DE, then the angle ABH is called the angle of incidence, and HBC the angle of reflection. Sometimes, however, the angle ABD is taken for the angle of incidence, and CBE for that of reflection. These two angles are in the same plane, and the angle of reflection is equal to the angle of incidence, and on the opposite side of the perpendicular. This law holds true whatever be the nature of the reflecting surface, or the origin of the light which falls upon it.—**Plane of reflection**, the plane passing through the perpendicular to the reflecting surface at the point of incidence and the path of the reflected ray of light or heat.—**Total reflection**, when a ray of light traversing a refracting medium is totally reflected at the surface of the medium, so that it does not issue from it at all.—2. Yet not the sun, but his reflection, there. *Dryden.*

5. The action of the mind by which it takes cognizance of its own operations.

2. That which reflects; specifically, (a) a polished surface of metal, or any other suitable material, applied for the purpose of reflecting rays of light, heat, or sound in any required direction. Reflectors may be either plane or curvilinear; of the former the common mirror is a familiar example. Curvilinear reflectors admit of a great variety of forms, according to the purposes for which they are employed; they may be either convex or concave, spherical, elliptical, parabolic, or hyperbolic, &c. The parabolic form is perhaps the most generally serviceable, being used for many purposes of illumination as well as for various highly important philosophical instruments. Its property is to reflect, in a parallel stream and to a great distance, all rays diverging from the focus of the parabola, and conversely. A series of parabolic mirrors, by which the rays from one or more lamps were reflected in a parallel beam, so as to render the light visible at a great distance, was the arrangement generally employed in lighthouses previous to the invention of the Fresnel lamp or dioptric light. The annexed cut is a section of a ship lantern fitted with an argand lamp and parabolic reflector. *a a* is the reflector, *b* the lamp, situated in the focus of the polished concave paraboloid, *c* the oil cistern, *d* the outer

See TELESCOPE.

Refraction (rĕ-frak'shon), *n.* The act of refracting or state of being refracted: almost exclusively a term in physics, and generally applied to a deflection or change of direction impressed upon rays of light or heat obliquely incident upon, and passing through a smooth surface bounding two media not homogeneous, as air and water,—or upon rays traversing a medium, the density of which is not uniform, as the atmosphere. This deviation or bending is the ultimate fact from which many of the most interesting phenomena of light receive their explanation. Suppose a beam of light proceed from a luminous point *s* to be admitted through a small hole *A*, in the side of a vessel *AB*; then, the vessel being empty, the light will fall on the bottom at a point *I*, in the same straight line with *s* and *A*. Now let water be poured into the vessel, and suppose the beam of light to fall on its surface at *P*; then it will be seen that the light no longer continues its course in the same straight line, but is bent or *refracted* at *P*, and proceeds through the water in a straight line *P R* more nearly perpendicular to the surface. A similar deviation takes place in all cases in which light passes from one transparent medium into another; but the magnitude of the angle *RPI*, or the amount of the refraction, varies according to the nature of the two media, and the degree of obliquity with which the incident ray falls on the surface of separation.

If through *P*, *Q R Q* be drawn perpendicular to the surface; then *SPQ* is the angle of incidence, and *R P Q* the angle of refraction, and

transparent medium into another; but the magnitude of the angle *RPI*, or the amount of the refraction, varies according to the nature of the two media, and the degree of obliquity with which the incident ray falls on the surface of separation.

oil, pound; ū, Sc. abune; ŷ, Sc. fey.

both these angles are in the same plane, and they are always on opposite sides of the perpendicular. The sine of the angle of incidence has to the sine of the angle of refraction a constant ratio, whatever be the inclination of the incident ray to the surface. When a ray of light passes from a rarer into a denser medium the refraction is towards the perpendicular, or the angle of refraction is less than the angle of incidence. On the contrary, when a ray of light passes from a denser into a rarer medium, the refraction is from the perpendicular, or the angle of refraction is greater than the angle of incidence. A familiar instance of refraction is the broken appearance which a stick presents when thrust partly into clear water, the portion in the water apparently taking a different direction from the other portion.—*Astronomical or atmospheric refraction*, the apparent angular elevation of the heavenly bodies above their true places, caused by the refraction of the rays of light in their passage through the earth's atmosphere, so that in consequence of this refraction the heavenly bodies appear higher than they really are. It is greatest when the body is in the horizon, and diminishes all the way to the zenith, where it is nothing. Tennyson uses the word figuratively apparently in this sense: he speaks of foretelling the future by

Such refraction of events
As often rises ere they rise.

—*Axis of refraction*. See **AXIS**.—*Conical refraction*, the refraction of a single ray of light, under certain conditions, into an infinite number of rays in the form of a hollow, luminous cone, and consisting of two kinds—*external conical refraction*, and *internal conical refraction*; the ray in the former case issuing from the refracting crystal as a cone with its vertex at the point of emergence, and in the latter being converted into a cone on entering the crystal, and issuing as a hollow cylinder.—*Double refraction*, the separation of a ray of light into two separate parts, by passing through certain transparent mediums, as Iceland-spar, one part being called the ordinary ray, the other the extraordinary ray. All crystals except those whose three axes are equal exhibit double refraction.—*Axis of double refraction*. See **OPTIC AXIS**, (b), under **OPTIC**.—*Index of refraction*. See **INDEX**.—*Plane of refraction*, the plane passing through the normal or perpendicular to the refracting surface, at the point of incidence and the refracted ray.—*Point of refraction*. See **POINT**.—*Terrestrial refraction*, that refraction which makes terrestrial objects appear to be raised higher than they are in reality. This arises from the air being denser near the surface of the earth than it is at higher elevations, its refractive power increasing as the density increases. The mirage is a phenomenon of terrestrial refraction.—*Refraction of altitude and declination*, of *ascension and descension*, of *latitude and longitude*, of the change in the altitude, declination, &c., of a heavenly body, due to the effect of atmospheric refraction.—*Refraction of sound*, the bending of a beam of sound from its rectilinear course whenever it undergoes an unequal acceleration or retardation, necessarily turning towards the side of least velocity, and from the side of greatest velocity.

Relevation (rē-lē-vā'shon), *n.* A raising or lifting up.

Reliability (rē-lā-bil'it-i), *n.* The state or quality of being reliable; reliableness. *Coleridge.*

Reliable (rē-lā-a-bl), *a.* Such as may be relied on; fit or worthy to be relied on; to be depended on. This word has been again and again attacked by different writers, having been at various times stigmatized

as an Americanism, as irregular in formation, as unnecessary, as vulgar, and what not. Against such charges, however, it has found able defenders, the most notable of whom is Mr. Fitzedward Hall, in his little work *On English Adjectives in -able*, with *Special Reference to Reliable*. The first instance of its use as known to him was in a paper written by Coleridge to the *Morning Post* in 1800, the expression in which it occurs being 'the best means, and most *reliable* pledge.'

Coleridge used it repeatedly afterwards; and it has also been used by many good writers since. It is now, indeed, of everyday occurrence, though no doubt certain persons still object to the use of it. Among those who have employed it Mr. Hall mentions Rev. James Martineau, Mr. Gladstone, Dr. Newman, Mr. John Stuart Mill, Dr. Henry Maudslay, Bishop Wilberforce, Dean Mansel, Harriet Martineau, and Mr. Leslie Stephen—names surely sufficient to support any one who chooses to use the vocable in question. That it is unnecessary is not quite the fact, at least we can hardly admit that its place is already sufficiently occupied by *trustworthy* or *trusty* as is usually stated. 'If this were true,' says Mr. Hall, 'inasmuch as we have *trust*, verb and substantive, there would be no need of *rely* and *reliance*; they must be wholly superfluous. But we *rely* where we look for support; we *trust* where we apprehend no deception; and *reliable* and *trustworthy* or *trusty*, properly employed, are no less different than their respective verbs. In corollary to this, *rely* except metaphorically, has not a personal reference, whereas *trust* has; and the best writers who have hitherto practically accepted *reliable*, have applied it to things solely. That many persons use *reliable* instead of *trustworthy* is, of course, no ground for rejecting it.' That it is formed after a somewhat uncommon model is also no sufficient ground for rejecting it, when we find in good use such words as *available*, such as one may avail one's self of; *conversible*, such as may be conversed with; *dispensable*, that may be dispensed with, and similarly *indispensable*; *laughable*, worthy of being laughed at, and sundry others. Altogether it seems too late in the day to protest against the use of the word now; those who do not like it can let it alone; but as Professor Whitney remarks (the quotation is from Mr. Hall):—'We have had to swallow too many linguistic camels, to want to make life more uncomfortable by straining at such gnats as that.'

According to General Livingston's humorous account, his own village of Elizabethtown was not much more *reliable*, being peopled in those agitated times by unknown, unrecommended strangers, guilty-looking Tories, and very knavish Whigs. *Irving.*

He (Mr. Grote) seems to think that the *reliable* chronology of Greece begins before its reliable history. *Gladstone.*

Above all, the grand and only *reliable* security, in the last resort, against the despotism of the government, is in that case wanting—the sympathy of the army with the people. *J. S. Mill.*

The sturdy peasant . . . has become very well accustomed to that spectacle, and regards the said lord as his most *reliable* source of trinkets and other pecuniary advantages. *Leslie Stephen.*

Reliability (rē-lā-a-bl-nes), *n.* The state or quality of being reliable; reliability.

But the number of steps in an argument does not subtract from its *reliableness*, if no new premises of an uncertain character are taken up by the way. *J. S. Mill.*

This relief consisted of horses, arms, money, and the like, the amount of which was originally arbitrary, but afterward fixed at a certain rate by law. The term is still used in this sense in Scots law, being a sum exigible by a feudal superior from the heir who enters on a feu; also called *casualty of relief*. In Scots law it is also applied to the right of recovering money paid in certain cases; thus if an heir pays a debt legally payable by an executor he has *relief* against the executor.—*Relief Church*, a body of presbyterian dissenters in Scotland, whose ground of separation from the Established Church was the violent exercise of lay patronage which obtained in the latter. Gillespie, its founder, was deposed by the General Assembly of the Established Church in 1752, and the first Relief presbytery met October 22, 1761. In 1847 the Relief and Secession Churches amalgamated and formed the United Presbyterian Church.—*SYN.* Alleviation, mitigation, aid, help, succour, assistance, remedy, redress, indemnification.

Religion (rê-lîj'on), *n.* [Fr. *religion*, from *L. religio, religiosis*, religion, piety, conscientiousness, scrupulousness, from *religio*, to bind back—*re*, back, and *ligo, ligare*, to bind, to bind together. Others derive *religio* from *relegere*, to gather, to collect, making the primary meaning a collection, and then more specifically a collection of religious formulas.] 1. The feeling of reverence which men entertain towards a Supreme Being or to any order of beings conceived by them as demanding reverence from the possession of superhuman control over the destiny of man or the powers of nature; the recognition of God as an object of worship, love, and obedience; right feeling towards God as rightly apprehended; piety. Religion, as distinguished from *morality*, denotes the influences and motives to human duty which are found in the character and will of God, while *morality* is concerned with man's duty to his fellows. As distinguished from *theology*, religion is subjective, designating the feelings and acts of men which relate to God, while *theology* is objective, and denotes those ideas or conceptions which man entertains respecting the God whom he worships, especially his reasoned and systematized ideas concerning God.

It will be easily perceived that *religion* means at least two very different things. When we speak of the Jewish, or the Christian, or the Hindu *religion*, we mean a body of doctrines handed down by tradition, or in canonical books, and containing all that constitutes the faith of Jew, Christian, or Hindu. Using *religion* in that sense, we may say that a man has changed his *religion*, that is, that he has adopted the Christian instead of the Brahminical body of religious doctrines, just as a man may learn to speak English instead of Hindustani. But *religion* is also used in a different sense. As there is a faculty of speech, independent of all the historical forms of language, so we may speak of a faculty of faith in man, independent of all historical *religions*. If we say that it is *religion* which distinguishes man from the animal, we do not mean the Christian or Jewish *religions* only, we do not mean any special *religion*, but we mean a mental faculty, that faculty which, independent of any, in spite of, sense and reason, enables man to apprehend the Infinite under different names, and under varying disguises. Without that faculty, no *religion*, not even the lowest worship of idols and fetiches, would be possible; and if we will but listen attentively we can hear in all *religions* a groaning of the spirit, a struggle to conceive the inconceivable, to utter the unutterable, a longing after the Infinite, a love of God. Max Müller.

2. Any system of faith and worship; as, the *religion* of the Greeks, Jews, Hindus, Mohammedans, Christians, &c. See extract above, § 3. 3. The rites or services of religion; the practice of sacred rites and ceremonies. 'Gay *religions* full of pomp and gold.' Milton. —Established *religion*, that form of religion in a country which is recognized and sanctioned by the state, in distinction from other forms, and to which certain privileges and distinctions are attached. —Natural *religion*, the knowledge of God and of our duty which is derived from the light of nature or of the unaided reason. —Revealed *religion*, the knowledge of God and of our duty which comes to us from positive revelation. —To get *religion*, to be converted; a term in use among certain religious sects in the United States.

Religion, Devotion, Piety, Sanctity. Religion is what binds men to God, and is often external. Devotion is the state in which men vow to be obedient to him; it always implies the internal subjection of the man to God. Piety is the filial sentiment which we cherish to Him as our Father. Sanctity is the habitual holiness which a sense of his law and character inspires. Angus.
